Monument Preservation On Site

HOCHSCHULE ANHALT University of Applied Sciences

Bartholomew Church Brunswick

Background

The eventful history of St Bartholomew's Church in Braunschweig is typical of buildings of this type. The church building dates back to a medieval original structure. As the city grew, the building underwent continuous transformation and was adapted to meet the requirements of the times.

This project draws on architectural-historical research carried out between 2023 and 2026 by the Institute of Architectural History at the Technical University of Braunschweig as part of the heritage conservation restoration of St Bartholomew's Church. Based on these findings, the heritage conservation guidelines for the restoration by Krekeler Architekten are examined and illustrated using specific examples from the craft trades carrying out the work. Building research, heritage conservation and design within a heritage building are addressed in parallel on a single site, highlighting the interaction between these specialist disciplines.

Project Concept & Objectives

Das In a teaching, research and practice project, architectural-historical analyses and reconstructions of construction phases are combined with student designs from the Institute for Architectural Design at the TU Braunschweig and the actual heritage conservation plans drawn up by KREKELER Architekten. The designs illustrate various scenarios showing how church interiors can be enriched with new functions in the future, thereby maintaining their significance within the urban landscape.
